

# Pointers and Modular Programming

## Chapter 6

*Problem Solving & Program Design in C*

*Eighth Edition*

*Jeri R. Hanly & Elliot B. Koffman*

# Chapter Objectives

- To learn about pointers and indirect addressing
- To see how to access external data files in a program and to be able to read from input file and write to output files using file pointers
- To learn how to return function results through a function's arguments
- To understand the differences between call-by-value and call-by-reference

# Chapter Objectives

- To understand the distinction between input, inout, and output parameters and when to use each kind

# Pointers

- pointer (pointer variable)
  - a memory cell that stores the address of a data item
  - 8 bytes on on server but depends on machine
  - syntax: *type \*variable*

```
int m = 25;
```

```
int *itemp; /* a pointer to an integer */
```

# Pointers

- pointer (pointer variable)
  - a memory cell that stores the address of a data item
  - 8 bytes on on server but depends on machine
  - syntax: *type \*variable*

```
int m = 25;  
int *itemp; /* a pointer to an integer */  
itemp = &m; /* itemp points to m */
```

# & operator (address of)

- Returns the address of a variable

the \* *never* returns the address of a variable

# \* operator (indirection)

- Follows a pointer to what it points to
- (the thing at the address it stores)

# Indirection/indirect reference

accessing the contents of a memory cell through a pointer variable that stores its address

**FIGURE 6.1**

Referencing a Variable Through a Pointer

**TABLE 6.1** References with Pointers

Reference	Cell Referenced	Cell Type (Value)
itemp	gray shaded cell	pointer (1024)
*itemp	cell in color	int (25)

# Pointers to Files

- C allows a program to explicitly name a file for input or output.
- Declare file pointers:
  - `FILE *inp; /* pointer to input file */`
  - `FILE *outp; /* pointer to output file */`
- Prepare for input or output before permitting access:
  - `inp = fopen("infile.txt", "r");`
  - `outp = fopen("outfile.txt", "w");`

# Pointers to Files

- `fscanf`
  - file equivalent of `scanf`
  - `fscanf(inp, "%lf", &item);`
- `fprintf`
  - file equivalent of `printf`
  - `fprintf(outp, "%.2f\n", item);`
- closing a file when done
  - `fclose(inp);`
  - `fclose(outp);`

# Segmentation fault

- Runtime error
- Means you tried to access memory that you weren't allowed to access
- Examples of causes:
  - trying to read from a file that wasn't open
  - following a dangling pointer
  - accessing data beyond array bounds

# Segmentation fault

- Runtime error
- Means you tried to access memory that you weren't allowed to access
- Examples of causes:
  - trying to read from a file that wasn't open
  - following a dangling pointer
  - accessing data beyond array bounds

let's introduce a segmentation fault in read.c

# The NULL pointer

- Uninitialized pointers point somewhere
- NULL is a pointer that points nowhere
- 0 also works for the null pointer

```
int* ptr = NULL;
```

```
if (myptr == NULL) {
```

```
    ...
```

```
    ...
```

# sizeof() function

- Gives the number of bytes that a variable or value takes up

## sizeof(m)

- On our server:
  - Char: 1 bytes
  - Int: 4 bytes
  - Float: 4 bytes
  - Double: 8 bytes
  - Pointer: 8 bytes

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {
```

```
    int *b;
```

```
    int n;
```

```
    n = 5;
```

```
    b = &n;
```

...

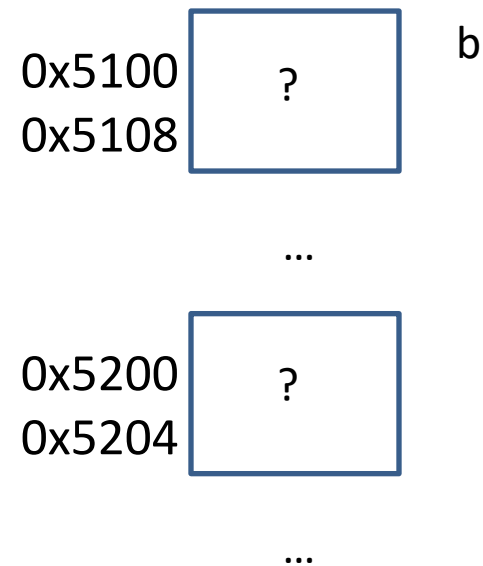

...

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
    n = 6;  
    *b += 1;  
    *b = 2 * (*b);  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
    n = 6;  
    *b += 1;  
    *b = 2 * (*b);  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
    n = 6;  
    *b += 1;  
    *b = 2 * (*b);  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
    n = 6;  
    *b += 1;  
    *b = 2 * (*b);  
    b = 2 * (*b);  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
    n = 6;  
    *b += 1;  
    *b = 2 * (*b);  
    b = 2 * (*b);  
}
```

# Pointers

- Create an integer pointer variable and set it

```
int main(void) {  
    int *b;  
    int n;  
    n = 5;  
    b = &n;  
    n = 6;  
    *b += 1;  
    *b = 2 * (*b);  
    b = 2 * (*b);  
}
```

**ptr0.c shows seg fault accessing \*b**

# Functions with Output Parameters

- We've used the return statement to send back one result value from a function.
- We can also use output parameters to return multiple results from a function.

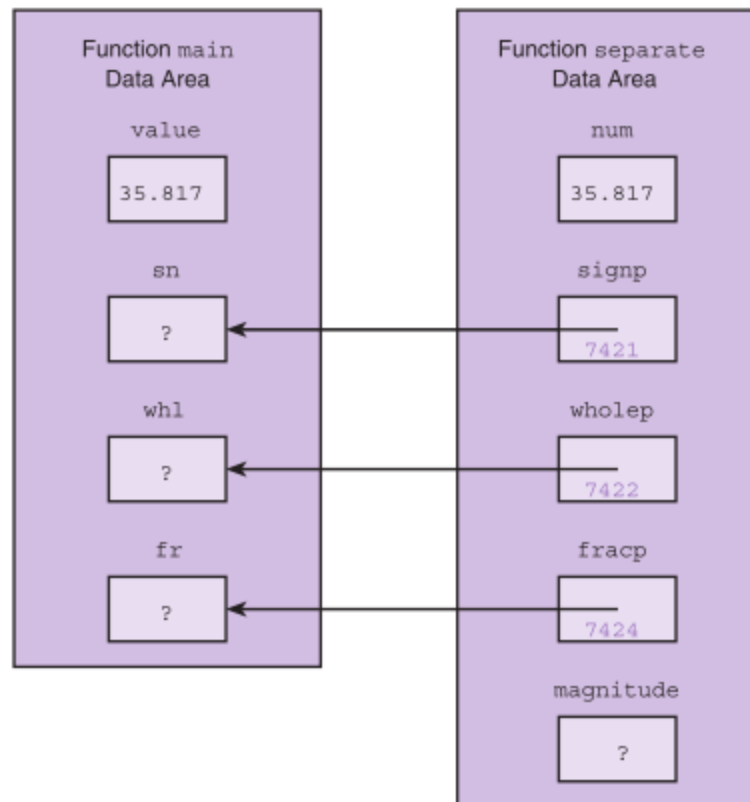

**FIGURE 6.4**

Diagram of  
Function separate  
with Multiple  
Results

**FIGURE 6.6**

Parameter  
Correspondence  
for `separate(value,  
&sn, &whl, &fr);`

**TABLE 6.2** Effect of & Operator on the Data Type of a Reference

Declaration	Data Type of x	Data Type of &x
<code>char x</code>	<code>char</code>	<code>char * (pointer to char)</code>
<code>int x</code>	<code>int</code>	<code>int * (pointer to int)</code>
<code>double x</code>	<code>double</code>	<code>double * (pointer to double)</code>

# Meaning of Symbol \*

- binary operator for multiplication
- “pointer to” when used when declaring a variable or a function parameters
- unary indirection operator in a function body

# Multiple Calls to a Function with Input/Output Parameters

An example of sorting data

**TABLE 6.3** Trace of Program to Sort Three Numbers

Statement	num1	num2	num3	Effect
<code>scanf("...", &amp;num1, &amp;num2, &amp;num3);</code>	7.5	9.6	5.5	Enters data
<code>order(&amp;num1, &amp;num2);</code>				No change
<code>order(&amp;num1, &amp;num3);</code>	5.5	9.6	7.5	Switches num1 and num3
<code>order(&amp;num2, &amp;num3);</code>	5.5	7.5	9.6	Switches num2 and num3
<code>printf("...", num1, num2, num3);</code>				Displays 5.5 7.5 9.6

**FIGURE 6.8**
