

**Discrete Structures (CSCI 246)**  
Homework 4 — Bonus

---

Recall that a binary tree  $T$  is either:

1. null (the empty tree), or
2. a root node  $r$  with two binary trees  $T_\ell$  and  $T_r$  as its left and right subtrees.

Prove **by structural induction** that for every binary tree  $T$ ,  $\text{countLeaves}(T)$ , defined below, returns the number of leaves of  $T$ .

---

**Algorithm 1**  $\text{countLeaves}(T)$

---

```
1: if  $T$  is null then
2:   return 0
3: else
4:   Let  $T_\ell, T_r$  be the left and right subtrees of  $T$ 
5:   if  $T_\ell, T_r$  both null then
6:     return 1
7:   else
8:     return  $\text{countLeaves}(T_\ell) + \text{countLeaves}(T_r)$ 
```
