}

Let *L* be an arbitrary regular language over the alphabet $\Sigma = \{0, 1\}$. Prove that the following languages are also regular. (You probably won't get to all of these during the lab session.)

1. Let INSERTANY1s(*L*) is the set of all strings that can be obtained from strings in *L* by inserting *any number of* 1s anywhere in the string. For example:

INSERTANY1s({ ε , 1, 00}) = { ε , 1, 11, 111, ..., 00, 100, 0111110, 111011111101111, ...}

Prove that the language INSERTANY1s(L) is regular.

Solution: Let $M = (Q, s, A, \delta)$ be an arbitrary DFA that accepts the regular language *L*. We construct a new *NFA with* ε *-transitions* $M' = (Q', s', A', \delta')$ that accepts INSERTANY1s(*L*) as follows.

Intuitively, M' guesses which 1s in the input string have been inserted, skips over those 1s, and simulates M on the original string w. M' has the same states and start state and accepting states as M, but it has a different transition function.

$$Q' = Q$$

$$s' = s$$

$$A' = A$$

$$\delta'(q, 0) = \{ \delta(q, 0) \}$$

$$\delta'(q, 1) = \{$$

$$\delta'(q, \varepsilon) = \{$$

2. Let DELETEANY1s(*L*) is the set of all strings that can be obtained from strings in *L* by inserting *any number of* 1s anywhere in the string. For example:

DeleteAny1s({ ε , 00, 1101}) = { ε , 0, 00, 01, 10, 101, 110, 1101}

Prove that the language DELETEANY1s(L) is regular.

Solution: Let $M = (Q, s, A, \delta)$ be an arbitrary DFA that accepts the regular language *L*. We construct a new *NFA with* ε *-transitions* $M' = (Q', s', A', \delta')$ that accepts *DeleteAny* 1s(*L*) as follows.

Intuitively, M' guesses where 1s have been deleted from its input string, and simulates the original machine M on the guessed mixture of input symbols and 1s. M' has the same states and start state and accepting states as M, but a different transition function.

$$Q' = Q$$

$$s' = s$$

$$A' = A$$

$$\delta'(q, 0) = \{ \delta(q, 0) \}$$

$$\delta'(q, 1) = \{$$

$$\delta'(q, \varepsilon) = \{$$

3. Let INSERTONE1(L) := $\{x \mid y \mid xy \in L\}$ denote the set of all strings that can be obtained from strings in L by inserting *exactly one* 1. For example:

INSERTONE1({ ε , 00, 101101}) = {1, 100, 010, 001, 1101101, 1011101, 1011011}

Prove that the language INSERTONE1(L) is regular.

Solution: Let $M = (Q, s, A, \delta)$ be an arbitrary DFA that accepts the regular language *L*. We construct a new *NFA with* ε -transitions $M' = (Q', s', A', \delta')$ that accepts INSERTONE1(*L*) as follows.

If the input string w does not contain a 1, then M' must rejects it; otherwise, intuitively, M' guesses which 1 was inserted into w, skips over that 1, and simulates M on the remaining string xy.

M' consists of two copies of M, one to process the prefix x and the other to process the suffix y. State (q, FALSE) means (the simulation of) M is in state q and M' has not yet skipped over a 1. State (q, TRUE) means (the simulation of) M is in state q and M' has already skipped over a 1.

 $Q' = Q \times \{\text{True, False}\}$ s' = (s, False) A' = $\delta'((q, \text{False}), \mathbf{0}) = \{ (\delta(q, \mathbf{0}), \text{False}) \}$ $\delta'((q, \text{False}), \mathbf{1}) = \{$ $\delta'((q, \text{False}), \varepsilon) = \{$ $\delta'((q, \text{True}), \mathbf{0}) = \{$ $\delta'((q, \text{True}), \mathbf{1}) = \{$ $\delta'((q, \text{True}), \varepsilon) = \{$

4. Let $DELETEONE1(L) := \{xy \mid x \mid y \in L\}$ denote the set of all strings that can be obtained from strings in *L* by deleting exactly one 1. For example:

DELETEONE1({ ε , 00, 101101}) = {01101, 10101, 10110}

Prove that the language DELETEONE1(L) is regular.

Solution: Let $M = (\Sigma, Q, s, A, \delta)$ be a DFA that accepts the regular language *L*. We construct an *NFA with* ε *-transitions* $M' = (\Sigma, Q', s', A', \delta')$ that accepts DeleteOne1(*L*) as follows.

Intuitively, M' guesses where the 1 was deleted from its input string. It simulates the original DFA M on the prefix x before the missing 1, then the missing 1, and finally the suffix y after the missing 1.

M' consists of two copies of M, one to process the prefix x and the other to process the suffix y. State (q, FALSE) means (the simulation of) M is in state q and M' has not yet reinserted a 1. State (q, TRUE) means (the simulation of) M is in state q and M' has already reinserted a 1.

$$Q' = Q \times \{\text{True, False}\}$$

$$s' = (s, \text{False})$$

$$A' =$$

$$\delta'((q, \text{False}), 0) = \{ (\delta(q, 0), \text{False}) \}$$

$$\delta'((q, \text{False}), 1) = \{$$

$$\delta'((q, \text{False}), \varepsilon) = \{$$

$$\delta'((q, \text{True}), 0) = \{$$

$$\delta'((q, \text{True}), 1) = \{$$

$$\delta'((q, \text{True}), \varepsilon) = \{$$

Work on these later: Consider the following recursively defined function on strings:

 $evens(w) := \begin{cases} \varepsilon & \text{if } w = \varepsilon \\ \varepsilon & \text{if } w = a \text{ for some symbol } a \\ b \cdot evens(x) & \text{if } w = abx \text{ for some symbols } a \text{ and } b \text{ and some string } x \end{cases}$

Intuitively, evens(w) skips over every other symbol in w, starting with the first symbol. For example, $evens(THE \diamond SNAIL) = H \diamond NI$ and $evens(GROB \diamond GOB \diamond GLOB \diamond GROD) = RBGBGO \diamond RD$.

Let *L* be an arbitrary regular language over the alphabet $\Sigma = \{0, 1\}$.

- 5. Prove that the language UNEVENS(L) := $\{w \mid evens(w) \in L\}$ is regular.
- 6. Prove that the language $EVENS(L) := \{evens(w) \mid w \in L\}$ is regular.
